Liquid crystal display devices have been

used to provide image display on a display screen of televisions, personal computers and the like. However, liquid crystal display devices are not self-luminous and thus require a light source. Recently, light-emitting devices that are able to emit light by themselves, i.e., light-emitting devices that are self-luminous, have been and are being developed. In particular, light-emitting devices using light-emitting diodes (LEDs) are suitable for achieving weight reduction and thinning. In recent years, light-emitting devices using organic electroluminescent elements (organic EL elements) as self-luminous light-emitting elements have been proposed. An organic EL element is an element formed using a layer that contains an organic compound

as a light-emitting material (light-emitting layer) sandwiched between a pair of electrodes. FIG. 8 is a schematic cross section showing a configuration of a light-emitting device 90 disclosed in Patent Literature 1. FIG. 8 shows an example of a light-emitting device 90 formed by mounting a light-emitting element 91, a heating member 92, a display medium 93 and a reflector 94 as described in Patent Literature 1. The light-emitting device 90 is configured so that light emitted from the light-emitting element 91 is emitted from the rear surface of the reflector 94
